# Project ELAR

I am building a website for Language Arts. My website idea would be to have students move through a module all about the same topic. For example, Module 1 may be titled "Courage in the Face of Fear". The students would read a passage, answer questions about it to check comprehension, learn about grammar, and then have a writing prompt on it.

Implementing the code came from considering what we had learned in the class and putting it into practice. I learned a lot about how to work with and around bootstrap classes. A modification I made was using a login modal instead of having login information on the homepage. As soon as I started my project, I knew I wanted to use Bootstrap Tabs for the module page. Also, when I work on this project again, I will use Sassy CSS and come up with names for the colors so I can call back to them.

Personally, I felt encouraged by my project. I found the experience fun, and I feel like I made the right choice in pursuing web development. I learned that if a part of code isn't working like I thought it should, sometimes the best choice is to walk away. More often than not, the answer would come to me when I wasn't sitting in front of a computer, or it would occur within the first few minutes of looking at the code after a break.

When I work on this project again, I will add form functions to the module page. I will also finish the About Us page, although I am thinking about moving the accordion to that page and putting something else on the home page.
