Active Money

I am creating a subscription based website with a focus encouraging families to become mentally and physically fit. The idea is to have the family subscribe to one of the family plans available, the parent will fund their children's account with money and as the child reaches that goal they are allowed to receive monetary gifts or be rewarded with screen time.

As I progressed in class I knew that I needed to implement a number of bootstrap elements such as nav, forms, cards, and many other Bootstraps elements. I started out using a Bootstrap template , but quickly realized that I wanted to customize and design the website. I added a video library that will be further customized as I progress in the Full stack courses, such as React.

I learned that knowing how to code is about knowing basic ideas and becoming a great researcher. I found out that I knew more than I thought and it's okay to " fail". Failure helps you learn and you will never forget how to write that piece of code again, that does mean you won't double check with StackoverFlow just to be sure.

There is so much more I want to add to this project, especially as I learn the backend.
